// summary

DevOps engineer who treats infrastructure as a product. I build self-service platforms that turn cloud and CI/CD complexity into one-line, reusable building blocks dev teams can ship with on their own. Currently driving the org-wide CI/CD and IaC strategy at Phoenix Financial, augmenting day-to-day work with GitHub Copilot, Claude Code, and custom agent skills / MCP servers.

Jan 2025 - Present ACTIVE

DevOps Engineer @ Phoenix Financial

Driving the org-wide CI/CD and Infrastructure-as-Code platform at one of Israel's largest insurance enterprises. The platform is a self-service catalog of reusable, opinionated components: dev teams compose blueprints to ship to production without DevOps becoming a ticket queue.

- **Reusable GitHub Actions workflow library.** Standardizes build, test, security scanning, image publishing, and deploy across every tech stack. Eliminates per-team pipeline duplication and config drift.
- **AWS CDK blueprint library.** Composable constructs for Lambda, API Gateway, EKS, ECS, Aurora/RDS, SQS/SNS, EventBridge, Step Functions, AWS Batch, S3, Route 53, CloudFront, Secrets Manager, and IAM. Teams import a construct and get a hardened deployment with logging, alerting, and least-privilege baked in.

- **Custom Python tooling and CDK constructs.** Glue AWS services together, automate operational flows, and enforce org-wide guardrails (tagging, cost controls, security baselines).
- **On-prem legacy stack alongside the cloud platform.** Self-hosted Kubernetes, Jenkins pipelines, and ArgoCD GitOps deploys. Bridges legacy systems into the new self-service AWS platform.
- **DevOps knowledge center + RAG-backed MCP server.** Architecture docs, blueprints, and runbooks queryable from Cursor, Claude Code, or Copilot. Other teams' developers get answers from their agent instead of pinging DevOps.
- **AI-augmented DevOps, end to end.** Power-user of GitHub Copilot and Claude Code; authored agent skills, prompts, and MCP integrations that compress repetitive work (pipeline scaffolding, IaC reviews, doc lookups, on-call triage) from hours to minutes.
- Power-user of GitHub Copilot and Claude Code; authored agent skills, prompts, and MCP integrations that compress repetitive DevOps work (pipeline scaffolding, IaC reviews, doc lookups, on-call triage) from hours to minutes.

2022 - 2024 COMPLETED

DevOps Engineer @ Develeap @ Civ Robotics

Built the DevOps function from scratch at a robotics startup. Software delivery, embedded deployment, and IoT integration from the ground up.

- Built the company's first CI/CD pipelines with GitHub Actions, Bash, Docker, AWS, and JFrog Artifactory. Automated, repeatable delivery for both cloud services and embedded targets.
- Simplified embedded deployment by cross-compiling and packaging applications as Debian packages inside Docker, turning brittle manual installs into a one-command flow.
- Decomposed a monolithic repository into domain-focused repos, improving modularity, ownership, and parallel team workflow.
- Integrated robots as AWS-managed IoT devices for remote logging, real-time telemetry, secure tunneling, and OTA-style deployment.

AWS | GitHub Actions | Docker | Bash | JFrog | AWS IoT | Debian

03 // PROJECTS

cloudblox/ Personal IaC platform. Production-grade AWS infra from a single `blox.yaml`.

PRIVATE · PRE-LAUNCH

The platform layer between DevOps and developers. At scaling startups, 1-2 DevOps engineers field every infra request: devs can't self-serve, DevOps can't keep up. CloudBlox solves both: DevOps writes infra once,

developers ship on every push.

// HOW IT WORKS

- Composable **blocks** (EKS, RDS, Lambda, ECS, static-sites, more) provision real AWS resources. Pulumi runs under the hood; devs never write or see Pulumi code.
- Two-repo model: **infra repo** (DevOps owns shared platform) and **gitops repo** (developers own workloads). One CLI, same `cloudblox deploy` flow for both.
- GitOps-friendly: every workload is declared in YAML, versioned, and reviewed in PRs. Rollback is a git revert.

// STACK

TypeScript | Pulumi | Node CLI | AWS | EKS | RDS | Lambda | CloudFront | Route 53 | GitHub Actions

amir-resume-site/

This resume. Dogfooding CloudBlox to ship its own demo site.

DEPLOYED VIA CLOUDBLOX

The site you're reading is a self-demo of CloudBlox: the same product I'm building deploys this resume to AWS from a tiny YAML file.

// WHAT IT SHOWS

- Defined in a 10-line `blox.yaml` using the `static-site` block.
- Provisions S3 + CloudFront + Route 53 + ACM end to end.
- Pushed by the same CLI CloudBlox ships to its users.
- Built fully static (no JS) so it's fast, indexable, and prints clean to PDF.

04 // EDUCATION

2 entries

DevOps Engineer Bootcamp @ Develeap 2022

Competitive-entry, 800-hour bootcamp covering the full cloud-native stack: Docker, Kubernetes, AWS, Terraform, Jenkins/GitLab/GitHub Actions, Artifactory, networking, certificates, and release lifecycle.

Full-Stack Web Development @ Elevation Academy 2020

520-hour MERN bootcamp. End-to-end projects with clean architecture, external API integrations, and hackathon-driven collaboration.

05 // TRAITS
